

Summary

+ STOCK TRANSFERS

- + + Show the 'transfer' check box against each line on a sales order all of the time, so long as there is appropriate stock within the business.
- + + Against each Store, add a setting for 'enable for order fulfilment'. If set to no, but stock from that store is reserved to a sales order, that stock should be added to 'transfers needed' (defaults destination to the selling store)
- + + When in transit, allocated lines now read as 'do not allocate (manual ordering only)' - this is to fix a bug where the allocation remained with the source location until the stock transfer was completed, causing overallocation issues
- + + If a product is deleted while in transit, a placeholder product will be created to receive the stock and allow associated orders to be processed
- + + Addition of the ability to reject a stock transfer line. This creates a new Stock Transfer (or add to an existing one), moving the stock back to the origin store. If tagged on a line that has been partially received, it will only reject the stock that has not yet been received.
