

Recommended Setup - Stores and Stock Locations

This page is not intended to act as iron clad rules, rather as a general guide. Your specific setup may vary, but it is important to understand some of the underlying logic behind these decisions, and how your systems can adapt to the real world realities of your business.

Stores are a key component to the setup of your system, and are integral to your reporting and stock management; please speak to Iconography and read this guide thoroughly prior to beginning setup

Making significant changes to your Store setup once you are live is not recommended and may result in significant problems throughout the system

Setup

Each physical site managing stock should be set up as its own Store. Doing so will ensure:

- Proper [Stock History](#) and movement reporting via [Stock Transfers](#)
- Multiple receiving Stores for [Purchase Orders](#)
- Sales reporting per Store
- Payment reporting per Store

However, please be aware of the following limitations:

- Stock availability is more limited (e.g. Stock must be Transferred prior to allocation)
- Visibility of stock in the POS will be affected

Selling Stores

This is a Store that is used as a store front; a Store from which you sell. There is only one essential requirement, and the rest are optional, based entirely on your setup. See here for more information.

- Enable for stock management
- Enable for collection
- Enable for web sales fulfilment
- Allow as a replenishment source
- Default receiving store

Locations

Your Locations should emulate your physical setup, but please consider granularity when building out your Stores.

One option would be to have a different Location for each individual shelf. This will increase visibility and accuracy of [Stock Holding](#) reports, but will make stock management more onerous, as the slightest movement will need to be accounted for within a [Stock Transfer](#).

Alternatively, you can opt for the bare minimum of stock Locations in your Store. This allows for easy movement of stock between shelves, as such movement doesn't require a proper Stock Transfer, but the downside is that you wouldn't have sight of which shelf a specific unit of stock is on.

At a minimum, a selling Store should have the following Locations set up:

- Received (available) (**recommended**)

- Display Stock (reserved)
- Sellable Stock (available)*
- Returns (unavailable)
- Supplier Returns (unavailable)

* In some Stores, this might be called 'Clearance'

Display Stock

This represents display stock in your Store.

This should be set as 'reserved', as this stock does have a value, and would be sellable were it not display stock.

Sellable Stock

The default location for sellable stock. This is the Location that should be expanded to reflect your physical setup, e.g. into multiple bays, shelves, floors, etc.

Returns

This should be your default returns location. All Customer returns to this Store will be returned to this Location.

This should be set up as 'unavailable', as this stock is not considered sellable without someone first completed quality assurance.

Requires additional setup at Store level.

Supplier Returns

This is only required if you are managing [Supplier Returns](#) from this Store.

To manage Supplier Returns, all returnable items must be in an unavailable Location.

Adding a specific Location for 'Supplier Returns' will give you clear visibility of stock that is to be returned, along with its age and value.

Warehouse Stores

This is a Store that is used as a warehouse; a Store receives stock and transfers it to your selling Stores or despatches it to your Customers. There is only one essential requirement, and the rest are optional, based entirely on your setup. See [here](#) for more information.

- Enable for stock management
- Enable for collection
- Enable for web sales fulfilment **(recommended)**
- Allow as a replenishment source **(recommended)**
- Default receiving store

Locations

Your Locations should emulate your physical setup, but please consider granularity when building out your Stores.

Some clients have numbered bays and shelves in their warehouse, while others split it up by product type, e.g. 'upholstery' vs 'beds', while still others will work from a single, all encompassing Location. Any of these setups is perfectly fine, but please ensure that you consult with Iconography prior to setting this up for the first time/making any changes to your current setup.

If you choose to have more Locations, this will increase visibility and accuracy of [Stock Holding](#) reports, but will make stock management more onerous, as the slightest movement will need to be accounted for within a [Stock Transfer](#).

Alternatively, you can opt for the bare minimum of stock Locations in your Store. This allows for easy movement of stock between shelves, as such movement doesn't require a proper Stock Transfer, but the downside is that you wouldn't have sight of which shelf a specific unit of stock is on.

At a minimum, a warehouse Store should have the following Locations set up:

- Received (available) (**recommended**)
- Sellable Stock (available)*
- Returns (unavailable)
- Return to Supplier (unavailable)

* In some Stores, this might just be called 'Available' or 'Warehouse'

Received

This is only required if you have multiple locations with available stock.

This Location is the Location that you should receive stock into from the [Goods In](#) screen.

The recommendation is that all stock is received into a generic goods received location. This emulates most warehouse practice, whereby stock is received at the door, and allows for that stock to be immediately available.

Your warehouse team should then transfer that stock to its actual Location once the physical movement has been created, e.g. moved from 'goods receivable' to 'shelf 1'.

Sellable Stock

The default location for sellable stock. This is the Location that should be expanded to reflect your physical setup, e.g. into multiple bays, shelves, floors, etc.

Returns

This should be your default returns location. All Customer returns to this Store will be returned to this Location.

This should be set up as 'unavailable', as this stock is not considered sellable without someone first completed quality assurance.

Requires additional setup at Store level.

Supplier Returns

This is only required if you are managing [Supplier Returns](#) from this Store.

To manage Supplier Returns, all returnable items must be in an unavailable Location.

Adding a specific Location for 'Supplier Returns' will give you clear visibility of stock that is to be returned, along with its age and value.

FAQs

I'd like to set up my system as a single Store even though I have multiple Stores. Can I do this?

Yes, you can, but it is not recommended. You may gain a few shortcuts in terms of stock management, but you will lose significant functionality, and your reporting will be impaired:

- You will lose the ability to report on sales and payments by different Stores
- [Stock History](#) reporting will not be as clear, there will be no need to record stock movements properly via [Stock Transfers](#)
- Physical stock movements will not be reflected in the setup of your system, meaning that [Stock Holding](#) will be unspecific

I would like to change my setup - can I do this?

Yes, but we would strongly recommend that you do not do this. Altering the setup of your Stores will have major impacts, as it can affect historical reporting, incoming Purchase Orders and Stock Transfers which are due into that Store, etc.

Can I delete a Store?

Yes, but not if it has held stock within it.

We strongly recommend against this action, as it can affect historical reporting, incoming Purchase Orders and Stock Transfers which are due into that Store, etc.

Can I delete a Location?

Yes, but not if it has stock held within it.
